                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /Clone="nbxb0088K00f"

                                                                                                        US-08-860-232-1 x 252304
                                                                                                                                                                                                                                                 The present cDNA sequence encodes the human p53 isoform, p35. This p53 isoform is truncated to eliminate a substantial portion of the C-terminal end of the protein. The deleted portion correspond to those encoded by exon 7 and by exons corresponding to amino acids lying C-terminal to exon 7. p35 is useful as a marker of myocardial infarction (by the indication of hypoxia) and in the control of cell proliferation both in vivo and in vitro. It was able to increase the transactivation achieved through co-transfection with wild type p53. The combination of p35 with wild type p53 produce an enhanced inhibition of primary incorporation at 24 hours compared to wild type p53 alone.

                                                                                                                                                                                                                                                                                                                              This sequence encodes the human p53 protein. The invention relates to CC assays for identifying an inhibitor of ubiquitin-mediated proteolysis of a cell-cycle regulatory protein comprising contacting a candidate agent with an ubiquitin-conjugating system and measuring the level of ubiquitination. The ubiquitin-conjugating system comprises:

(a) a reconstituted protein mixture including a ubiquitin conjugating enzyme (UDCE) produced by the expression of a nucleic acid which hybridizes under high stringency conditions to human UDCE, Candida albicans UDCE, or Schizosaccharomyces pombe UDCE coding sequences;

(b) a regulatory protein; and (c) ubiquitin. The polynucleotides are useful for identifying ubiquitination inhibitors. The polynucleotides (c) cluster of the treatment and/or diagnosis of proliferative disorders of sectors contective disorders cancer, atherosclerosis, or restenosis, tissue connective disorders controlling mound baling and disorders is connective disorders.

Variant forms of p53 are found in human breast, lung or colon carcinoma, lymphoma, leukaemia, etc., suggesting that mutation of the p53 genes is involved in oncogenesis. Specifically 273 Arg is replaced by 273 His, a mutation found exclusively in tumour cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cloned p53 cDNA and protein prods. - for suppression of neoplastic phenotype e.g. in osteo-sarcuma(s), leukaemia(s),

The plasmid pMM110 (see also 067864) contains the vaccinia H6 promoter and the wild type human p53 gene in the ALVAC C5 insertion site. The mutant p53 gene was obtained from plasmid Cx22A and cloned into pMM110 to generate pMM143. Recombination between pMM143 and ALVAC rescuing virus produced recombinant virus vCP270, which contains the vaccinia H6 promoted mutated human p53 in the C5 locus. The resulting virus may be used in a composition for inducing an antigenic or immunological response, ie. for immunisation against pathogens.

                                              patient and therefore induces an immunological response. (1) may be used to vaccinate patients against a wide range of diseases and disorders depending on the type of antigen encoded by the exogenous DNA. (1) may be used to vaccinate against diseases such as rables, influenza and Newcastle Disease. It is particularly useful for immunothing against cancers. The poxvirus (1) also provides a means of manipulating 12 lymphocytes and tumour cells for use in cell-based immunotherapeutic modalities for cancer. (1) also have enhanced safety compared to unattenuated viruses (attenuation reduces the virulence of the viruses) and known recombinant poxvirus vaccines. This increased level of safety reduces the possibility of a 'runaway' infection in the host and reduces the chance of transmission from vaccinated to unvaccinated individuals and contamination of the environment. The present sequence represents a human p53 gene used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               28-AUG-1987;
